EXECUTIVE SUMMARY

The Indiana Primary Care Needs Assessment (PCNA) has been critical in the efforts to identify gaps in access to health care and allocate resources to communities in greatest need. This five-year project, a collaborative effort between the Bowen Center for Health Workforce Research and Policy (Bowen Center) and the Indiana State Department of Health Primary Care Office, has encompassed numerous efforts to accomplish these goals. These efforts include: development of standard provider data management; statewide analysis of Health Professional Shortage Areas; and, the provision of resources and assistance to health care administrators and community leaders. The 2019 Primary Care Needs Assessment Report summarizes efforts from 2015-2018 and demonstrates how this project has impacted communities throughout Indiana.

The PCNA project began during a time in which the Health Resources and Services Administration (HRSA) initiated a modernization project to streamline the application process for Health Professional Shortage Area (HPSA) designations. In response to this, the Bowen Center has developed provider verification procedures which collect comprehensive information on providers' clinical practice (1, 2). With these verified data, the Bowen Center has been able to assist the Indiana State Department of Health in more effectively managing HPSA applications, obtaining designations for many underserved communities and proactively respond to regulatory changes in the designation process. A summary of the efforts for managing HPSA applications is provided in Section I.

While accurate and timely information on providers is crucial for a needs assessment, evaluating population data is also necessary for identifying emerging health outcomes. The Indiana PCNA project annually evaluates population health data derived from the U.S. Census and the Robert Wood Johnson Foundation. This ongoing evaluation, summarized in Section II, has shown that while certain health outcomes have remained consistently prevalent (such as diabetes and infant mortality) other serious health concerns have recently emerged (such as substance abuse).

In addition to managing provider and population data, the Bowen Center has also worked to maintain positive and effective communication with many health care administrators and community leaders throughout the state. It is important to note that as community needs change so will the efforts for responding to these needs. This report provides an outline of how previous efforts have improved outcomes, what changes still need to be made and how Indiana can move forward to improve access to care and health outcomes. Continued changes will only be possible with comprehensive research and collaborative efforts from researchers, community leaders and health care facilities.

SECTION I. 2018 HEALTH PROFESSIONAL SHORTAGE AREA DATA MANAGEMENT

Shortage Designation Management System and HPSA Applications

National Auto-HPSA Update

In 2016, the Health Resources and Services Administration (HRSA) began developing a plan for the update to Automatic HPSA (Auto-HPSA) facility designations. Throughout 2016 and 2017, HRSA worked with state PCOs to discuss the timeline and feasibility of this update. Similar to the National geographic and population HPSA update, preliminary score analyses – also known as Impact Analyses – were scheduled to be conducted from November 2018 to April 2019. Summary reports would then be provided to state PCOs and representatives of designated facilities shortly after.

In conjunction with the Indiana State Department of Health, the Bowen Center instituted a work plan which involved identifying all Auto-HPSA Facilities from the initial impact analysis that would expect a potential change in their score and the providers associated with their service area. The anticipated score change was then used to prioritize provider verification, which was completed in collaboration with Auto-HPSA facilities.

As of December 2018, 52 Auto-HPSA facilities are anticipated to experience a change in their scores for primary care, psychiatry or dental health. The Bowen Center has initiated a communication plan in which health care organizations can provide verified provider data for their facilities. This process has expedited provider verification and ensured that the most accurate data will be used during the national updated in 2019.

HPSA Designations, 2015 - 2018

Tables 1.1 – 1.3 on the subsequent pages provide a summary of the designations obtained between 2015 and 2018 for primary care, mental health and dental health. As can be observed for each discipline, Indiana had acquired very few HPSA designations at the beginning of the PCNA project in 2015 due to limited resources for conducting comprehensive needs assessments. However, establishment of provider data verification and management procedures developed by the Bowen Center for Health Workforce Research and Policy enabled the state to obtain an increasing number of designations between 2016 and 2018.

In a continuation of the efforts to obtain the most beneficial designations to communities, the Bowen Center has worked with stakeholders throughout 2018 to prepare HPSA applications. As a results of this effort, Indiana was able to obtain 29 geographic designations for dental health (27 designations) and primary care (2 designations). Additionally, 20 designations were also obtained for 19 correctional facilities, 1 Rural Health Clinic and 1 Federally Qualified Health Center Look-alike.

In addition to managing designations, the Bowen Center has also managed ongoing verifications of primary care physicians, psychiatrists and general dentists. It is anticipated that verifications will be completed in the spring of 2019 and verified data will then be used to inform new HPSA applications and update existing designations.

Primary Care

Primary care HPSA designations have continually been a major priority for the State of Indiana as needs assessments have demonstrated a shortage of primary care physicians in many parts of the state. Most designations obtained in 2015 and 2016 were for auto-HPSA facility designations. However, after implementation of newly developed provider data management procedures, Indiana was able to obtain a significantly higher number of geographic and population designations in 2017 and 2018. Table 1.1 provides more information on the primary care HPSA designations that have been obtained between 2015 and 2018.

Mental Health

Table 1.2 provides a summary of the mental HPSA designations Indiana has obtained between 2015 and 2018. As with primary care HPSA designations, many of the mental health HPSA designations obtained in 2015 and 2016 were primarily facility designations. Between 2017 and 2018, however, more mental health geographic and population designations were obtained primarily for mental health catchment areas. Enhanced communication with correctional health care systems has also facilitated increased mental health designations for correctional facilities throughout the state.

Dental Health

As has been noted in previous annual PCNA reports, Indiana has historically had very few dental HPSA applications. As is shown in table 1.3, only five dental HPSA facility designations were obtained in 2015 and 2016. However, a greater number of population designations have been obtained in 2017 and 2018 after implementation of provider verification and data management procedures.

Table 1.3 Dental health HPSA designations obtained 2015 - 2018

SECTION II. POPULATION HEALTH PRIORITIES IN INDIANA

Infant Mortality

Infant Mortality Rate, 2013 – 2017

It is well documented that, as compared to other states in the U.S., Indiana ranks poorly in regards to trends in infant mortality rates (IMR) (3). Moreover, many infant deaths in Indiana are considered to be preventable. Factors contributing to Indiana's infant mortality rate include congenital abnormalities, preterm birth, maternal health and access to prenatal care, maternal income status and environmental factors (4, 5). Additionally, examination of Indiana's infant mortality rate by race demonstrates that significant disparities exist. African American infants are more than twice as likely as white infants to die before their first birthday. Although there have been incremental improvements in Indiana's overall IMR over the past five years, these disparities persist (see figure 2.1). A more detailed summary of the trends in infant mortality in Indiana by county can be found in Appendix A.

Maternal and Child Health Initiatives – Labor of Love

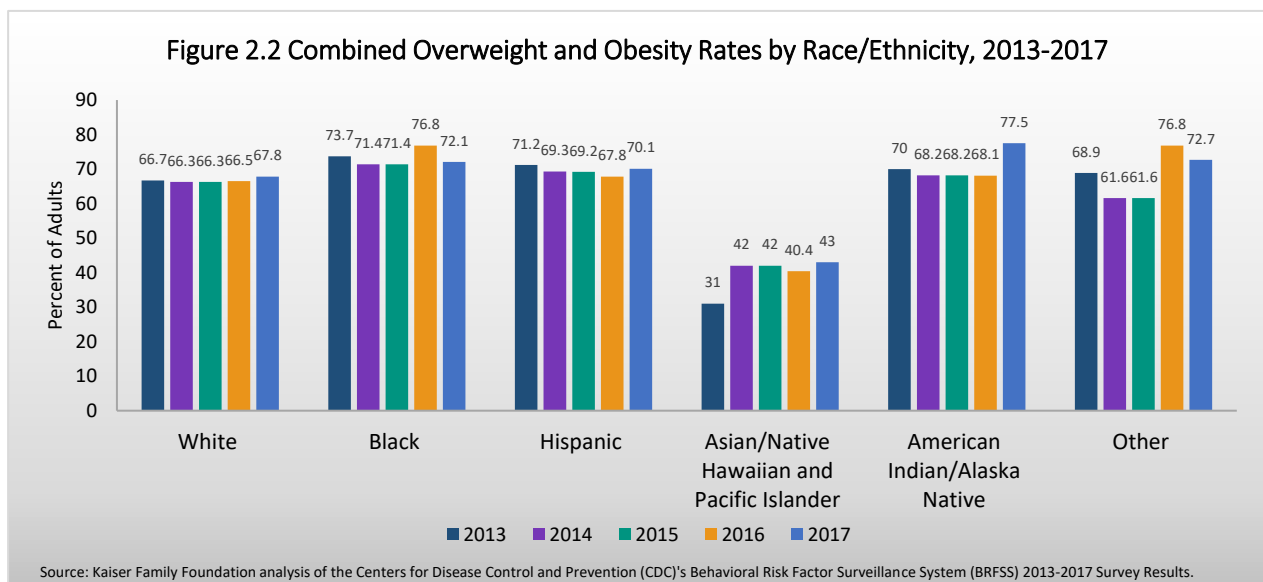

The Indiana State Department of Health is actively collaborating with key organizations and stakeholders to tackle some of the leading causes of IMR in Indiana¹. These collaborations led to the inception of the Labor of Love program in 2012 under the Indiana Perinatal Quality Improvement Collaborative (IPQIC), which focuses on perinatal health for women and treatment of substance use disorder during pregnancy. Expectant mothers can access educational information and services for regular and early prenatal care by phone using the MCH MOMS Helpline or on the website. ISDH and IPQIC monitor maternal and child health outcomes in the state of Indiana and produces yearly reports on IMR and maternal mortality rates.

¹ More information can be found at <https://www.in.gov/laboroflove/>

Obesity and Related Outcomes

Obesity Rate, 2013 – 2017

According to the 2017 annual report published by the Trust for America's Health and the Robert Wood Johnson Foundation, Indiana had the 10th highest rate of adult obesity in the United States (6). Additionally, it ranked 11th among the rates of children ages 10 to 17 who were obese. A total of 3.2 million adults in Indiana are estimated to be overweight and obese, while 1.7 million remain at risk of becoming overweight or obese (6). Overweight and obesity trends have continued to grow steadily over time as seen in figure 2.2. Poor nutrition and sedentary behaviors are large contributors to the obesity epidemic. Obesity continues to affect racial and ethnic minorities disproportionately compared to the white population. Health issues related to obesity, such as chronic disease, are also on the rise, as 11.8% of adults in Indiana had diabetes in 2017 and 35.2% had hypertension. Indiana ranked 11th and 10th respectively for those health issues in 2017 (6).

Obesity Related Initiatives – Indiana Healthy Weight

In an effort to combat the growing obesity rates, Indiana has state policies and initiatives in place. Established through the Indiana State Department of Health, The Indiana Healthy Weight Initiative serves as a coalition dedicated to supporting policy and priorities related to nutrition, physical activity, and obesity. Established by the coalition in 2008, *Indiana's Comprehensive and Physical Activity Plan, 2010-2020* is an effort to assess the specific needs across the state in order to improve nutrition and physical activity plan. Decreasing the percentage of adults who are obese to 25% and the percent of high school students to 10% are just some of the few goals of the plan (7).

Obesity Related Initiatives – Health by Design

Active living workshops are another initiative designed to promote physical activity through the collaboration of the Indiana State Department of Health Division of Nutrition and Physical Activity and Health by Design. Select communities are awarded resources to facilitate educational workshops guided by strategic plans, policies, programs, and projects².

Health Care Costs Related to Obesity

Obesity is known as a major driver of healthcare costs in the United State (8). Data suggests that emergency room costs for an individual who is obese are 41% higher compared to a normal weight patient. An increased BMI is positively associated with the number of days away from work, medical insurance claims, and overall healthcare costs. Additionally, obese adults spend 42% more on costs associated with direct healthcare compared to adults who are a normal weight (8). In relation to that, A 2011 report from the Indiana Department of Health indicated that health care spending for obesity-related conditions increased by 89% between 1998 and 2006 (9).

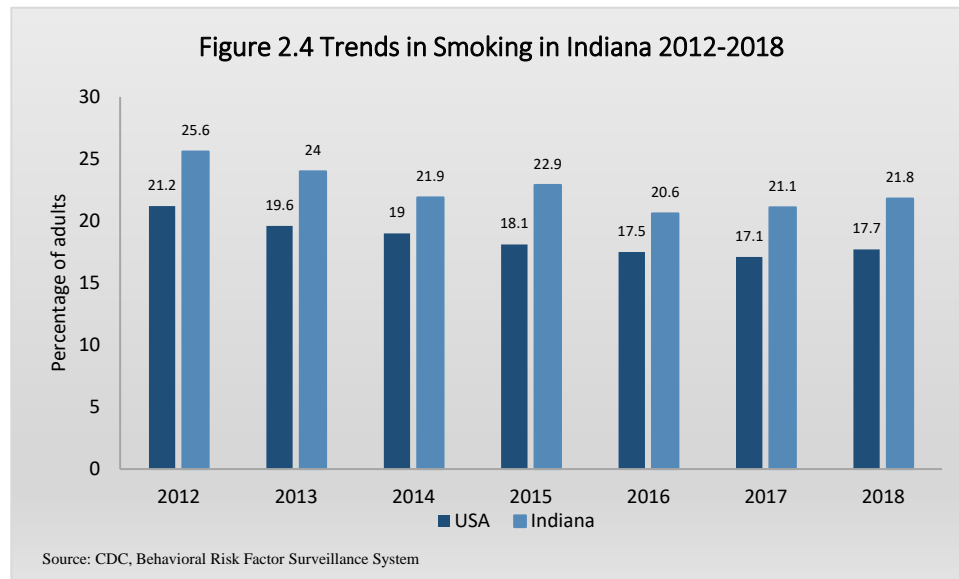

SNAP/WIC Benefits at Farmers' Markets

The Supplemental Nutrition Assistance Program (SNAP) allows participants to purchase from registered farmers markets as they are the most affordable source of fresh fruit and vegetable options. This benefit increases access to nutritional foods in communities that are considered “food deserts,” where individuals are at a higher risk for obesity (10). To encourage the access to farmers markets the United States Department of Agriculture (USDA) requires states to provide options for farmers markets and other retailers to have the capability to accept SNAP at no cost (11).

² More information can be found at <http://www.healthbydesignonline.org/aboutUs.html>

Smoking

The number of individuals that smoke in the United States has declined significantly over the past few years. Despite the decline, cigarette smoking continues to be the leading cause of preventable deaths. The tobacco epidemic is very prevalent in Indiana with an estimated 11,100 adult deaths each year from smoking related diseases (12). An estimated 21.1% of adults in Indiana were smokers in 2016 compared the national rate which was 17.1% (13). Despite smoking rates among adults being higher than the national average, figure 2.4 shows that the smoking rate has slightly decreased since 2012.

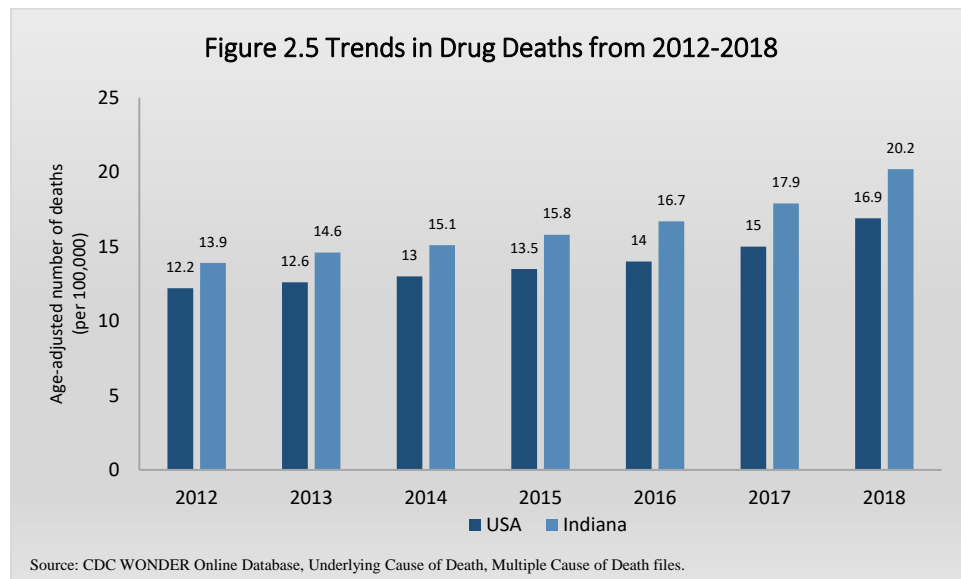

An estimated \$2.93 billion was spent in 2018 on health care costs related to smoking (not including exposure to secondhand smoke) (13). Reducing the number of smokers would likely reduce the cost of health care spending. The state of Indiana has put forth several policies to promote prevention and cessation of tobacco use. Passed on July 1, 2012, the smoke free air law deemed nearly all public places smoke free (15). Additionally, the State of Indiana offers a telephone-based tobacco quitline that provides services that help and educate tobacco users at no cost³ (15). Established in 2006, the quitline has had over 110,000 tobacco users call and receive assistance from trained quit coaches (16).

³ More information can be found at <https://www.in.gov/quitline/>

Substance Abuse

Drug-related deaths in the United States have grown exponentially over the past few years. As displayed in figure 2.5, Indiana has had a consistently higher rate compared to the national average (17). Indiana was identified by the CDC as one of a number of states identified as having statistically significant increases in drug overdose death rates specifically from 2016 to 2017 (17). As shown in figure 25, the rates of drug-related deaths in Indiana has consistently increased between 2012 and 2018. Appendix B also provides a detailed summary of trends in non-fatal hospitalizations in Indiana which involve any opioid overdose from 2011 to 2017.

According to a 2016 report by the Richard M. Fairbanks Foundation on the growing opioid epidemic in Indiana, 657 infants were born in 2014 with Neonatal Abstinence Syndrome (NAS) due to exposure to opioids in utero. In addition, the cost for treatment newborns with NAS in Indiana hospitals was over \$64 million in that same year (18). In response to the crisis, the Fresh Start Recovery Center was opened through the Indiana Department of Child Services. This residential addiction program accepts pregnant women who live in Indiana and are using opiates and provides program participants with residential treatment and resources at no cost (19).

Other initiatives formed to combat the opioid crisis include grants administered by the Indiana State Department of Health (ISDH). The naloxone distribution program offered in collaboration with the Indiana Criminal Justice Institute provides funding for naloxone kits to 63 local health departments that distribute them at no cost within their communities. The second grant supports an effort for ISDH to distribute naloxone to first responders. This grant is administered in partnership with the Overdose lifeline and provides funding that enables first responders in 49 targeted rural counties to be trained to carry and administer naloxone. In addition, the ISDH is working to expand the Indiana Recovery and Peer Support Initiative for referral to treatment services (20).

Closing Summary

This report has summarized the impact of the PCNA project since efforts were initiated in 2015. This project has identified gaps in access to health care which has allowed for improved use of resources and has assisted many different communities throughout Indiana. The milestones from the project from previous years have helped to fuel its progression and support new goals.

Preparation for the update to Automatic HPSA (Auto-HPSA) facility designations began in November 2018 and will continue until the summer of 2019. The Bowen Center and ISDH have collaborated to identify contributing factors for potential score changes due to the update. The anticipated score change has allowed for the prioritization of provider verifications. With the help of the communication plan created by the Bowen Center, health care organizations will be able to provide their facilities with verified provider data during the national update.

Since the inception of the PCNA project in 2015, the number of HPSA designations obtained in Indiana has grown each year. In 2017, Indiana still lacked sufficient capacity of dentists throughout the state and a goal was set to acquire new dental HPSA designations where they were needed. In 2018, Indiana obtained 33 population designations for dental health. Indiana also acquired a significant number of HSPA designations in primary care and mental health between 2017 and 2018. This increased effort to inform and obtain designations has been facilitated by improved provider data management and stakeholder engagement. Increased support of provider recruitment through federal HPSA designations has improved health care access, and through continued effort this expansion will help improve health care outcomes for many underserved communities throughout the state.

Indiana's priorities in population health consistently highlight infant mortality, obesity, and smoking as health concerns. Initiatives in place to address these concerns have been implemented and continue to inform policy and future initiatives. Substance abuse has recently emerged as a top health concern and is currently one of Indiana's population health priorities. This has increased awareness regarding the need for and expansion of mental health services. The Bowen Center continues to work with state agencies and community leaders to produce data that can be utilized to monitor changes in population needs and identify gaps in health services.

The Indiana Primary Care Needs Assessment project has provided valuable data on workforce capacity and health care access needs in Indiana. As the Bowen Center continues its effort to increase health workforce research and inform policy, future work will continue to provide data that further improves health care access and health outcomes.
