Rivers of the Anthropocene

Jason M. Kelly

IUPUI Arts & Humanities Institute.

Rivers of the Anthropocene is a transdisciplinary project examining global river systems since 1750. Approaching rivers and their landscapes not simply as natural phenomena but as human-nature entanglements, an international network of researchers, policy makers, artists, teachers, and community organizations seek to create a new framework for understanding and addressing one of the most pressing ecological issues of the 21st century: water security.
