We thank Drs Dell’Asta and Ghi for their comments on our recent publication. Their thoughtful commentary and discussion of some of the associations of antenatal steroid exposure with adverse neonatal outcomes remind clinicians that we must consistently weigh the risks and benefits of interventions. The benefits of antenatal corticosteroids outweigh the risks for preterm-born neonates. We agree with the authors that identification of the pregnant patients who will deliver preterm, compared with those who will go on to deliver at term, is a key clinical question. A “wait-and-see” approach that they suggest is a reasonable approach in the evaluation of threatened preterm birth, particularly for those patients who may not have advanced dilation of the cervix.
